

Chemical Imaging System

Suitable for first responders and stadium security, Bruker Corp.'s SIGIS 2 is a chemical imaging system which automatically identifies airborne chemical compounds at distances up to 10 km.

Equipped with automated 360-degree rotation capability of the measurement head, SIGIS 2 allows a wide area to be measured and recorded, including real-time video images.

The system enables a user to define the field of view and test for the presence of VOCs, TICs, and other airborne hazardous materials from a safe distance, without exposing the user or the measurement device to the chemical being measured.
