

LC Column Line for Protein Separations

Protea Biosciences Group has introduced its Amplus wide-pore core shell HPLC columns, a line of liquid chromatography columns designed for intact protein analysis.

The HPLC silica-based columns employ core shell technology combined with a specific porosity designed to facilitate proteins separation, including those with high molecular weight.

Amplus was developed in collaboration with CromaNik Technologies and is available in different chemistries and porosities to facilitate and resolve separations in top down proteomics studies.
