

Stage-Top Incubator System

Warner Instruments has introduced the Okolab Bold Line stage-top incubator system for live cell imaging.

The incubator is suitable for longitudinal studies of cell cultures and features an easy-to-use touchscreen interface.

The system is a complete apparatus designed to provide precise control of the parameters essential for creating an environment that is as close as possible to the conditions within a living organism. The combine action of a temperature controller, gas mixer, and humidifier acting on the stage-top chamber ensures that a specimen feels at home.

By adding an optional Smart Box, users have the ability to control and monitor system performance through any Web-enabled device.
